## Bunker Stuhl by Marco De Gregorio • 2026 WINNER • Liquid Domesticity

Exploring the tension between mass and emptiness, an original block is carved into fluid shapes, organically transforming into a cohesive seat, backrest, and base.The chair is entirely made in one piece with biodegradable plastic plus cork and using the most sophisticated 3-dimensional technology, coupled with the appropriate human expertise, passion and resilience.“In my world a chair summarizes a small architectural building where the functionality meet the aesthetic and the art.” (MDG)Lines and geometry, spaces and void, high, depth, dimensions, rules...are we talking about a chair, a building or a sculpture?That is why the design of the Bunker Stuhl reflects the principles of my personal design concept, aiming to create a functional seating element that resonates with the aesthetic qualities of large-scale architectural structures. This philosophy can be translated into furniture design by focusing on form and structure; This involves creating a silhouette that is both striking and practical, allowing for easy integration into various environments.Functionality, the Bunker Stuhl is designed to be comfortable while maintaining its architectural shaped integrity.Ergonomic Design; While the visual appeal is paramount, it is essential to ensure that the seating element provides adequate support. A major effort was to find the right balance considering seat height, back rest angle, and overall dimensions to accommodate users comfortably and ergonimically. The chair is made with an advanced 3d printing technology that uses a specific robot to make it in one piece.
